Polynucleotide(s) and proteins derived stored on computer readable medium and S.aureus vaccines. from Staphylococcus aureus - in the production of anti-

Claim 1; Page 2287; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or 얹

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (gub-transcriptome comprises messenger RNAs transcribed from multiple coligonucleotides, each capable of hybridising selectively to a set of which encodes one or more messenger RNAs transcription unit of the genome, oligonucleotide ilbraries are useful for detecting mixing trom a gloven transcription unit of the genome, oligonucleotide libraries are useful for detecting mixing from a gloven transcription of the genome, oligonucleotide libraries are useful for detecting mixing from a quantitatively characterising the corresponding transcriptome, and in quantitatively characterising the corresponding transcriptome, and in transcriptomes. The libraries may also be used as specialised mini
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human spliced transcript detection oligonucleotide SEQ ID NO:18015
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S. aureus infection. The S. aureus in a sample. S. aureus in a kit for the immunodetection of including cellulitis, evelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating readable medium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15-JUL-2002 (first entry)

       This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The range of diseases are used for diagnosis and/or prognosis of cancer and a central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABF99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH32073 data for this patent did not form part of the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                     Set of oligonucleotides, useful for diagnosis and cell typing, designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                       Claim 1; SEQ ID NO 269218; 29pp + Sequence Listing; German

                                                                                                                                                                                                                    This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligoners for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Set of oligonucleotides, useful for diagnosis and cell typing, designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotide primer SEQ ID NO 267933 for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           22-FEB-2002

The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABH2074 to ABH207546 represent oligonucleotide sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method (MI) for designing capture oligonuclectide probes (II) will hybridise with little mismatch, where oligonuclectide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; K-ras; PCR primer; probe; capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCA1; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Designing capture oligonucleotide probes complementary oligonucleotides hybridize
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Barany F,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            04-APR-2001; 2001WO-US010958.

The compound and methods are useful in diagnosing and treating developmental disorders e.g. lympoedemas such as lympoedema-distichiasis, dysgeneses of the mouse irridocorneal angle similar to those seen in human Axenfeld-Rieger anomaly and congenital glaucoma. The present sequence is an antisense oligonucleotide targeting forkhead box
                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New compound targeted to a nucleic acid molecule encoding forkhead C2, useful in diagnosing and treating developmental disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 15; SEQ ID NO

                                                                             The invention relates to a new compound 8-80 nucleobases in length (an antisense oligonucleotide) targeted to a nucleic acid molecule encoding forkhead box C2, where the compound specifically hybridises with the nucleic acid molecule encoding human forkhead box C2 appearing as ANN31339 and inhibits the expression of forkhead box C2 appearing as screening for a modulator of forkhead box C2 in cells or tissues, screening for a modulator of forkhead box C2, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with forkhead box C2. The compound and methods are useful in diagnosing and treating developmental disorders e.g. lympoedemas such as lympoedema-distichiasis, dysgeneses of the mouse irridocorneal angle similar to those seen in human Axenfeld-Rieger anomaly and congenital glaucoma. The present sequence is an antisense oligonucleotide targeting forkhead box
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 15; SEQ ID NO 74; 80pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compound targeted to a nucleic acid molecule encoding forkhead C2, useful in diagnosing and treating developmental disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2004-399740/37

                                                                                                                                                                                                                                                                                   The invention relates to a new compound 8-80 nucleobases in length (an antisense oligonucleotide) targeted to a nucleic acid molecule encoding forkhead box C2, where the compound specifically hybridises with the nucleic acid molecule encoding human forkhead box C2 appearing as ANN31339 and inhibits the expression of forkhead box C2 also included are inhibiting the expression of forkhead box C2 in cells or tissues, screening for a modulator of forkhead box C2, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with forkhead box C2. The compound and methods are useful in diagnosing and treating developmental disorders e.g. lympoedemas such as lympoedemadistichiasis, dysgeneses of the mouse irridocorneal angle similar to those seen in human Axenfeld-Rieger anomaly and congenital glaucoma. The present sequence is a forkhead box C2 nucleic acid region targeted by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; ss; antisense; forkhead box C2; developmental disorder; lympoedema; lympoedema-distichiasis; dysgenesis; iridocorneal angle;

                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes the human chromosome 11-linked coronary compared to the germline are indicative of a predisposition to coronary heart disease or to metabolic disorders related to lipid metaboliam. Products from the CC present invention can be used in the diagnosis of predisposition to coronary heart disease and to metabolic disorders, including coronary heart disease and to metabolic disorders, including chypoalphalipoproteinaemia, familial combined hyperlipidaemia, insulin coronary heart disease and metabolic disorders, obesity, diabetes and dyslipidaemic hypertension. CHD1 proteins can be used for treating coronary heart disease and metabolic disorders. The products can also be coronary heart disease and metabolic disorders. The products can also be coronary heart disease and metabolic disorders. The products can also be coronary heart disease and metabolic disorders. The products can also be coronary heart disease and metabolic disorders. The products can also be coronary heart disease and metabolic disorders. The products can also be coronary heart disease and metabolic disorders. The products can also be coronary heart disease and metabolic disorders. The products can also be cared for detection and drug screening. ANZ26812 to ANZ27027 to ANZ27027 prepresent human CHD1 nucleotide sequences used in the cared in the identification of human CHD1; ANZ26842 to ANZ27014 represent pCR primers used in the screening of mutations in human CHD1; anzersent pCR primers used in the screening of mutations in human CHD1; anzersent invention.

                                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a DNA methylation inducer (I) containing double-
CC stranded (ds)RNA that targets the region which contains CpG or CpNG (N is
CC A, T, C or G) on DNA in mammalian cell, or expression vector (VI) having
CC DNA that codes dsRNA that targets the region which contains CpG or CpNG
CC which involves introducing (I) is useful in the DNA methylation process,
CC cell is obtained from human. (I) is useful as gene expression inhibitor
CC cell is obtained from human. (I) is useful as gene expression inhibitor
CC cell is obtained from human. (I) is useful as gene expression inhibitor
CC cell is obtained from human. (I) is useful as gene expression inhibitor
CC cell is obtained from human. (I) is useful is gene to the disease related gene
CC cell is obtained from human. (I) is useful for
CC cell is obtained from human. (I) is useful for
CC cell is obtained from human. (I) is useful for
CC cell is obtained from human. (I) is useful for
CC cell is obtained from human. (I) is useful for
CC controlling gene expression, where the disease related gene
CC controlling various biological activities in a mammal by controlling the
CC containing domain on a gene promoter of the target gene, where the
CC containing domain on a gene promoter of the target gene, where the
CC containing domain on a gene promoter of the target gene, where the
CC containing domain on a gene promoter of the target gene.
CC (I) induces sequence specific gene at the expression for the target gene.
CC (I) induces sequence specific gene at the transcription level. (I)
CC mables DNA methylation in the promoter region of a gene, where the
CC gene expression at the transcription of a gene, where the
CC gene expression at the transcription of a gene, where the
CC gene expression at the transcription of a gene, where the
CC gene expression at the transcription level (DNA to mNA). This sequence
CC corresponds to an erbB2 gene PCR primer used in the method to silence
                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                          Query Match
Capture oligonucleotide Zip ID#762 oligo #2.
                                                                                                                            ABI83921 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel DNA methylation inducer containing double-stranded RNA targeting region having CpG on DNA in mammalian cell, useful in suppressing gene expression, and as cell growth inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 4; SEQ ID NO 60; 98pp; Japanese.
                                                                                                                                                                                                                                                                                                                                    Local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2004-662014/64.

                                                                                                                                                                                                                                                                                                             (1) have melting temperatures within a narrow range. The method is useful CC e.g. Salmonella, Listeria monocytogenes and Haemophilus inflectious agents CC infectious agents e.g. Cryptococcus neoformans. Candida albicans and CC Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, CC Epstein-Barr virus and polio virus, and parasitic infectious agents CC esteried from Onchoverva volvulus, Entamosba histolytica and Dracunculus CC medinesis. The method is also useful for detecting genetic diseases such CC petecting cancer involving oncogenes, tumour suppressor genes, or genes CC cancer is specifically associated with a gene selected from BRCA1 gene, human papillomavirus types 16 and 18 and liver cancers. The CC p53 gene, human papillomavirus types 16 and 18 and liver cancers. The CC and feed industry, detecting comprises scanning (using e.g. a scanning celectron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe consense or absence of the target mucleotide sequences. The invention relates to novel isolated G-protein coupled receptor (GPCR) CC polypeptides and polynucleotides. The GPCR polypeptide, GPCR nucleic acid CC and antibody are useful for treating, preventing or alleviating a GPCR-CC associated disorder or a patchological state in a subject, particularly a CC human. In particular, the disorder is cardiomyopathy, atherosclerosis, CC diabetes, or a disorder related to cell signal processing and metabolic CC pathway modulation. The GPCR polypeptide and mucleic acid are also useful CC for diagnosing the presence of or predisposition to a disease associated CC and polypeptide are especially useful in therapeutic or prophylactic CC applications for disorders associated with abternant GPCR expression or CC treating the above conditions. Furthermore, the nucleic acids and CC polypeptides are useful in treating adenocarcinoma, lymphoma, prostate CC ancer, uterus cancer, immune response, neurodegenerative disorders, CC albright hereditary osteodystrophy. These are also useful in developing a CC powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. ABSS9747-ABSS9211 represent human CC GPCP ording arminers and morbes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               24-JAN-2001;

ABQ88354 to ABQ88417 represent human G protein coupled receptor (GPCR) cDNA sequences, and ABP51560 to ABP51624 represent human GPCR proteins from the present invention. GPCR sequences can have neuroprotective, nootropic, anti-HIV, antiasthmatic, antiarteriosclerotic, cytostatic, immunomodulator, antiinflammatory, antidiabetic, anorectic, haemostatic, antibacterial, fungicide, protozoal, virucide, nephrotropic, osteopathic, cardiant, antiulcer, antiallergic, hepatotropic and antiparkinsonian
                                                                                                                                                                 New isolated human G-protein coupled receptor x (GPCRX) polypeptide, useful for treating or preventing GPCRX-associated disorders e.g. diabetes, atherosclerosis, cancer or obesity.
                                                                                                                                     Example 3; Page 245; 354pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 activities, and can be used in vaccines and gene therapy. GPCR proteins, nucleic acid molecules, and antibodies from the present invention can be used for manufacturing a medicament for treating or preventing a GPCR-associated disorder or syndrome related to cell signal processing and metabolic pathway modulation, such as cardinoyopathy, atherosclerosis, diabetes, cancer, obseity, infections (bacterial, fungal, protozoal or viral), HIV, asthma, Parkinson's disease, osteoporosis, Crohn's disease, allergies, cirrhosis, glomerulonephritis, stroke, systemic lupus erythematosus, or haematopoietic disorders. Anti-GPCR antibodies can be used diagnostically to monitor protein levels in tissues as part of a clinical testing procedure such as in determining the efficacy of a given treatment regimen. AB084318 to AB086339 represent PCR primers and probes for the human GPCRs of the present invention
                                                                                                                                                                                                                                       10-JAN-2001;
                                                                                                                                                                                                                                                                               18-DEC-2000;

                                                                                                                                                                                                                                                               polypeptide. The polypeptide, nucleic acid, antibody, and their CC biologically active derivatives or fragments, are useful in determining the predisposition to or presence of GPCRX-associated disorders or Syndromes and in manufacturing a medicament for treating, diagnosing or CC expreventing the said disorders such as cancer (e.g. breast or ovarian cc cancers), hypercalcaemia, endometriosis, Crohn's disease, appendicitis, CC cirrhosis, infertility, cardiovascular disorders (e.g. cardiomyopathy, CC atherosclerosis), autoimmune diseases (e.g. scleroderma, systemic lupus cerythematosus), diabetes, pancreatitis, Alzheimer's disease, stroke, CC myasthenia gravis, schizophrenia, renal disorders (e.g. cglomerulonephritis, renal tubular acidosis), and/or other similar CC pathologies and disorders. The polypeptides are also useful as immunogens CC to produce antibodies and as vaccines. The present sequence represents a CC GPCR primer of the present invention.

The promoter has cis transcriptional regulatory activity. Cells containing the promoter attached to a non-UCP2 gene, in which the non-UCP2 gene is a reporter gene can be used in screening assays for modulators of UCP2 gene expression, which may be useful for treating disorders in which the UCP2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mitochondrial protein; cis transcriptional regulatory activity; therapy; expression modulator screening; fat feeding; diabetes; obesity; PCR primer; 88.

The oligonucleotides AAZ28763-Z28772 are used in a capture assay for Tatmodulated transcription of guanine (G)-less mRNA expression in viro, following addition of a potential transcriptional activator or inhibitor. The method is used to detect a selected RNA in a sample, comprising: (a) contacting a sample with an oligonucleotide comprising a region complementary to the selected RNA to form an RNA/DNA duplex, (b) cleaving single-stranded RNA in the sample, (c) binding RNA duplex to a sample with an oligonucleotide comprising a region complementary to the selected RNA to form an RNA/DNA duplex to a sample with a contact of the selected RNA to form an RNA/DNA duplex to a sample with a contact of the selected RNA to contact of the select
                                                                                                                                                                                                                                       Example I; Page 40; 60pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-FEB-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a PCR primer for the UCP2 promoter. The amplified sequence is used in the method of the invention, which is a screening assay for agents that modulate the effect of a transcription factor on a UCP2 promoter comprises combining the promoter and transcription factor in the presence and absence of a candidate agent an determining any change in the effect of the transcription factor on the promoter. The promoter comprises at least 50 nucleotides of a sequence comprising nucleotides 1-460 of the UCP2 promoter (see AAV08879). The method is used to identify agents that modulate UCP2 gene transcription (agents that upregulate UCP2 are potentially useful for treating diabete and obesity). (Updated on 20-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAZ28769;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAZ28769 standard;

                                                                                                                                                     Sequence
                                                                                                                                                                       The invention relates to a novel human zinc finger 32.56 polypeptide, encoding polynucleotide, an antagonist and a method for recombinant production. The polypeptide is useful for treating cancer and HIV infection. The current sequence is that of the human zinc finger 32.5.

```
AMI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).

CC AAM53114 to AAM5329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein cc polynucleotide sequences. The sequences can be used in gene and protein cc therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases cassociated with inappropriate expression of polymorphic polypeptides. For cc example, (I) may be used to treat disorders by rectifying mutations or cd eletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own cc production of polypeptide. Additionally, (I) and its complementary csequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic colypeptides in samples may also be used as diagnostic agents for detecting the presence of polymorphic colypeptides in samples may also be used as diagnostic agents for detecting the presence of polymorphic colypeptides in samples may also be used as diagnostic agents for detecting the presence of polymorphic colypeptides in samples may also be used as diagnostic agents for detecting the presence of polymorphic colypeptides may also be used as diagnostic agents for detecting the presence of polymorphic p

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide CC sequences (I) which contain single nucleotide polymorphisms (SNPs).

CC AAM53114 to AAM53329 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein CC them may be used in the prevention. (I) and the polypeptides encoded by CC associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat disorders by rectifying mutations or CC deletions in a patient's genome that affect the activity of polypeptides or Dy expressing inactive proteins or to supplement the patients own CC sequences may also be used as DNA probes in diagnostic assays to detect therefore which patients may be in need of restorative therapy. The antibodies specific for polymorphic polypeptides. The antibodies may also be used as antityes. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Pi Picoult-Newburg L, Pohl M;

PY absence or identity of single polymucleotide polymorphism in a nucleic Ry wew genotyping oligonucleotide, useful for detecting the presence, pri acid sample.

XX New genotyping oligonucleotide, useful for detecting the presence, pri acid sample.

XX New genotyping oligonucleotide, polymucleotide polymorphism in a nucleic series of single nucleotide polymorphism such a series of regions flanking sequence AAH37205 - AAH40944 represent PCR primers, single nucleotide grimer extension (SNPB) primers, and the sequences of regions flanking sequence, the SNPB primer is used as a genotyping a minimal primer.

XX Sequences AAH37205 - AAH40944 represente or absence of a SNP, using the primer extension control of the support of a SNP flanking the presence or absence of a SNP, using the primer is used as a genotyping primer.

CC oligonucleotides are useful for genotyping a nucleic acid sample by the oligonucleotides are useful for genotyping nucleic acid sample by the oligonucleotides are useful for genotyping primers.

CC performing a single-nucleotide primer extension reaction. The preforming a shaple-nucleotide primer extension reaction. The preforming a shaple-nucleotide primer extension reaction. The preforming a shaple-nucleotide primer is used as a genotyping primer.

CC oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to oligonucleotides are useful. For genotyping represence of an individual or group of caused by one or more SNPs. Phenotypic traits unspected of being agammajobultinamenta, disabetes insipidus, Lesch-Nyhan syndrome, muscular of caused by one or more SNPs. Phenotypic traits include diseases e.g.

CC disabetes imperfects and acute intermittent porphyria. Phenotypic craits also include symptoms of or susceptibility to multifactorial conditions and primer and primer and primer and pri

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC ABL00010 to ABL01104 represent human nucleic acid oligonucleotides
CC comprising one or more single nucleotide polymorphisms (SNPs). ABB56531
CC to ABB56903 represent human peptides encoded by some of the SNP
CC oligonucleotides. The sequences from the present invention can have
CC immunosuppressive, cytostatic, antiinflammatory, neuroprotective and
CC antinicrobial activities. Nucleic acids, polypeptides, oligonucleotides
CC and antibodies from the present invention can be used for treating a
CC subject suffering from, at risk for, or suspected of, suffering from a
CC pathology ascribed to the presence of a sequence polymorphism. The
CC pathology may be autoimmune diseases, inflammation, cancer, diseases of
CC the nervous system, and infection by pathogenic microorganisms. The SNPs
CC are also useful for determining which forms of a characterised
CC polymorphism are present in individuals. The antibodies may be used in
CC polymorphic protein (e.g., for use in measuring levels of the polymorphic
CC protein within appropriate physiological samples)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised mini libraries to detect transcripts of a sub-transcriptome under a particular libraries to detect transcripts of a sub-transcriptome under a particular
                                                and pathology-specific genes such as those genes only expressed in specific tissue under a specific genes fathological condition; to detect developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from rats, humans and mice, which are used in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit genome, useful for detecting tissue-, pathology-, and developmental-
                                                                                                                                                                                                                                                                                                                     biological or pathological state, and so allowing the detection of tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes oligonuclectide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcriptome, where the (sub-)transcriptome units that populate a genome. The library comprises several cc oligonucleotides, each capable of hybridising selectively to a set of comessenger RNAs transcribed from multiple cc which encodes one or more messenger RNAs splice variants. The clibraries are useful for detecting mRNAs from a cc quantitatively characterising the corresponding transcriptome, and in cc quantitatively characterising the corresponding transcriptome, and in cc detecting RNA transcripts and splice variants of human or animal cc libraries to detect transcripts of a sub-transcriptome under a particular condition to pathological state, and so allowing the detection of tissue specific tissue under a specific pathological condition; to detect variants of a transcriptome of a batient suffering from a particular cc disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from cc part of the printed specification, but was obtained in electronic format cf the grant invention. N.B. The sequence data for this patent did not format condition from wiffor at the was obtained in electronic format condition to the condition. The sequence data for this patent did not form cc directly from wiffor at the was obtained in electronic format condition.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for disgnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, oligomers are also used for detecting cell type differentiation. ABC00010-ABE39989, ABF00010-ABF39989, ABH00010-ABH39989 and ABI00010-ABH32073 represent the oligomers described in the invention. NOTE: The sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ABF27950;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic NNA. The range of diseases including immune system, gastrointestinal, respiratory, oligomers are also used for detecting cell type differentiation. ABC0010-ABF99999, ABF00010-ABF99999, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic format from WIPO at fitp.wipo.int/pub/published_pct_sequences

                                                                                                                                     This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99389, ABF00010-ABC99389, ABF00010-ABC99389, ABF00010-ABC99389, The oligomers described in the invention.                                                                                                                                                                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99389, ABF00010-ABF99389, ABH00010-ABH99389 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                           ABA95013 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                       The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (II)-2R gamma encoded RNA ANV93889 to ANV9576 represent specifically claimed ribozymes, and ANV9575 to ANV95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor
                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ribozymes targetted to autoimmune disease and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a structural protein-1 (SP-1) of infectious salmon anaemia virus (ISAV). The SP-1 polynucleotide, protein or specific antibodies are useful in diagnostics, and in vaccines to protect fish against infection with ISAV. The SP-1 polynucleotide is useful for producting vector vaccines against the virus, and for recombinant production of SP-1, substantially free from other ISA viral protein. The present sequence represents an oligonucleotide derived from the ISAV SP-1 DNA, that can be used as a primer. (Updated on 11-SEP-2003 to standardise os field)

The invention describes A synthetic ribozyme (I) receptor mRNA. A vector comprising (I) is useful receptor activity in cultured prostate cells, by preparation comprising the vector. The vector is inhibiting the proliferation of prostatic cancer received to the collection of prostatic cancer to the collection of prostation of

) that cleaves androgen
l for reducing androgen
y providing to the cells a
s also useful for
r cells in vitro, by
s. (1) is useful for

expressing
